

Phase A — technical validity
synthetic smoke run + engine invariant checks + leakage tests
produces trades, respects bounds, charges costs · says nothing about profitability

22 families
implemented
& registered

Phase B — development pilot (non-confirmatory)
2 assets × 1 seed × 15 folds · 60 evaluations per fold and engine
futility check only: pilot Sharpe is never quoted as evidence

partial signal: recorded and reported, unlocks nothing
(volatility breakout BTC: 6/10 positive seeds, 0/10 bootstrap CIs)

15 families
completed the
full study
(R2-R3, S1,
S2, CRT)

Phase C — full study
2 assets × 10 seeds × 15 folds
100 evaluations per fold and engine
+ full statistical battery (Ch. 6)

Promotion: all six frozen criteria (Table 3.2) — study outcome: 0 of 15
