

kept local, by design:
pyright (run before releases) · notebook determinism check
(needs the data lake, which never leaves the machine)

frontend gate (apps/web):
vitest — 112 tests · tsc · next build
run locally before each web change lands

ubuntu-latest · 25-minute timeout · a red gate blocks the merge — the stale-claims sweep fails CI if any committed document claims a result no artifact backs.
